

SSL-Certificates

To safely enter private, confidential, or other coded information, for example credit card numbers, a special SSL-Certificate must be installed in the domain. A protected connection through SSL is identifiable through the address, which begins with "https://..." instead of "http://...".

All SSL-Certificates are registered exclusively to a certain domain name (for example ssl.meinedomain.de). The SSL-Certificate is an alternative option for all sub-domains; these are called "WildCard-SSL-Certificates" (*.my_domain.de).

Our 128-Bit-SSL-Certificate is available for all standard web servers (for example Apache, IIS, and others). The browser compatibility is at least 99,3 percent.

Just ask us.
